

AQUADOPP PROFILER

400kHz, 600 kHz, 1/2 MHz with Z-cell option

Bottom framed Aquadopp Profiler: Typical applications include coastal studies, online monitoring and scientific studies in rivers, lakes, and channels. The Aquadopp Profiler works equally well in typical ocean surface water and in the high sediment suspensions found near the coast or in rivers.

The Aquadopp current profiler can be mounted on moving structures and will measure the relative motion between the structure and the water.

A standard current profiler cannot measure the complete profile from the bottom to the surface. Instead, it loses data close to the instrument and close to the far boundary. The Aquadopp Z-Cell extends the profiling range by introducing a «Cell Zero». The data is generated by an extra set of horizontal transducers. The transducers operate at a different frequency (2 MHz) and provide the 2D current velocity at the level of the instrument. This is to the benefit of anyone who is interested in the detailed current velocity in the boundary layer.

*) The Aquadopp profiler measures the current profile in a user specified number of cells from the instrument out to a maximum range that depends on the acoustic scattering conditions. The lower range should be expected with clear water and small cells and the higher range with large cells and acoustically turbid water.
